

FakeStore API Testing Report

Project Title

FakeStore API Testing using Postman

Objective

The objective of this project is to perform REST API testing on the FakeStore API using Postman. The testing includes validating CRUD operations, response codes, response body verification, and response time validation to ensure API reliability and functionality.

➤ Tools Used

-  Postman
-  FakeStore API
-  JSON
-  REST API

➤ APIs Covered

-  GET Products API
-  GET Single Product API
-  POST Product API
-  PUT Product API
-  DELETE Product API

➤ Validation Performed

-  Status Code Validation
-  Response Body Validation
-  Response Time Validation
-  JSON Data Verification

Test Execution Summary

The API collection execution was completed successfully with all test cases passed.

The average response time was below acceptable limits and no failures were observed during execution.

Outcome

The project successfully demonstrates API testing skills using Postman including automated assertions, CRUD operation validation, and collection runner execution.

Project Overview

This project demonstrates REST API testing using Postman for the FakeStore API.

The testing scope includes:

- GET API Validation
 - GET Single Product API Validation
 - POST API Validation
 - PUT API Validation
 - DELETE API Validation
 - Response Time Validation
 - Status Code Validation
 - JSON Response Validation
-

Test Execution Summary

Metric	Value
Project Name	FakeStore API Testing
Tool Used	Postman
Total APIs Tested	5
Execution Status	PASSED
Failed Tests	0
Average Response Time Below 500 ms	

APIs Covered and Results

1. GET Products API

Endpoint

GET <https://fakestoreapi.com/products>

Validations

- Status code is 200
- Response time below 2000 ms
- Products are returned

Result

PASSED

Snapshot:

2. GET Single Product API

Endpoint

GET <https://fakestoreapi.com/products/1>

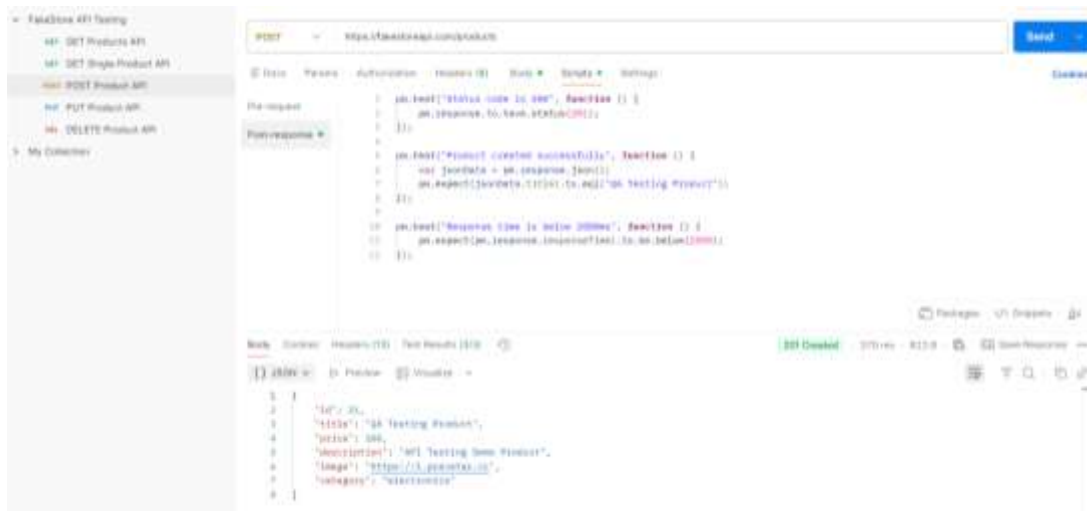

Validations

- Status code is 200
- Response time below 2000 ms
- Product ID validation

Result

PASSED

Snapshot:

3. POST Product API

Endpoint

POST `https://fakestoreapi.com/products`

Validations

- Status code validation
- Product creation validation
- Response time validation

Result

PASSED

Snapshot:

4. PUT Product API

Endpoint

PUT <https://fakestoreapi.com/products/1>

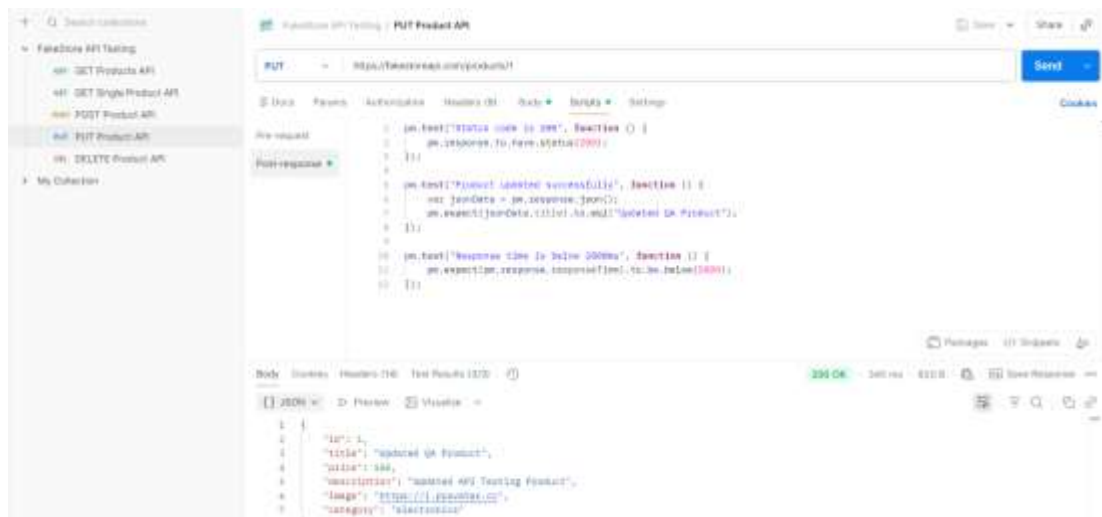

Validations

- Status code validation
- Product update validation
- Response time validation

Result

PASSED

Snapshot:

5. DELETE Product API

Endpoint

DELETE <https://fakestoreapi.com/products/1>

Validations

- Status code validation
- API execution validation
- Response time validation

Result

PASSED

Snapshot:

Collection Runner Summary

- Total Tests Executed: 6
- Passed Tests: 6
- Failed Tests: 0
- Average Response Time: 312 ms
- Overall Status: SUCCESS

Conclusion

The FakeStore API testing execution was completed successfully using Postman. All API requests passed the validation checks including response status, response body assertions, and response time validations.
